2 INTRODUCTION

2.1 General description

Welcome to the SD2DUG Software manual. This guide will cover the essentials of setting up and using the SD2DUG software included with your Dupline® System.

This software tool has been designed for the configuration and updating of the Dupline channel generator SD2DUG24: the communication parameters and the channel programming are set-up locally in the PC, and then transferred to the generator through a USB port. Likewise, data from the generator can be uploaded and modified.

To connect the PC to the SD2DUG any Micro-USB cable can be used (standard cable to connect to Android smart-devices).

Important note:

Out of the factory, the SD2DUG24 has the following settings:

- It repeats the input channels onto the output ones
- The generated Dupline frame has 128 channels
- The Modbus parameters are:
 - Address = 1
 - Speed = 9600
 - Data bits = 8
 - Parity = None
 - Stop bit = 1

Should these settings fit the ones of the system, no further configurations are needed and the SD2DUG24 can be directly powered and connected without any programming.

2.2 Hardware requirements

- The program operates with Windows 7 or higher, with Microsoft .Net 4.5 or higher installed
- A free USB port

2.3 Installation

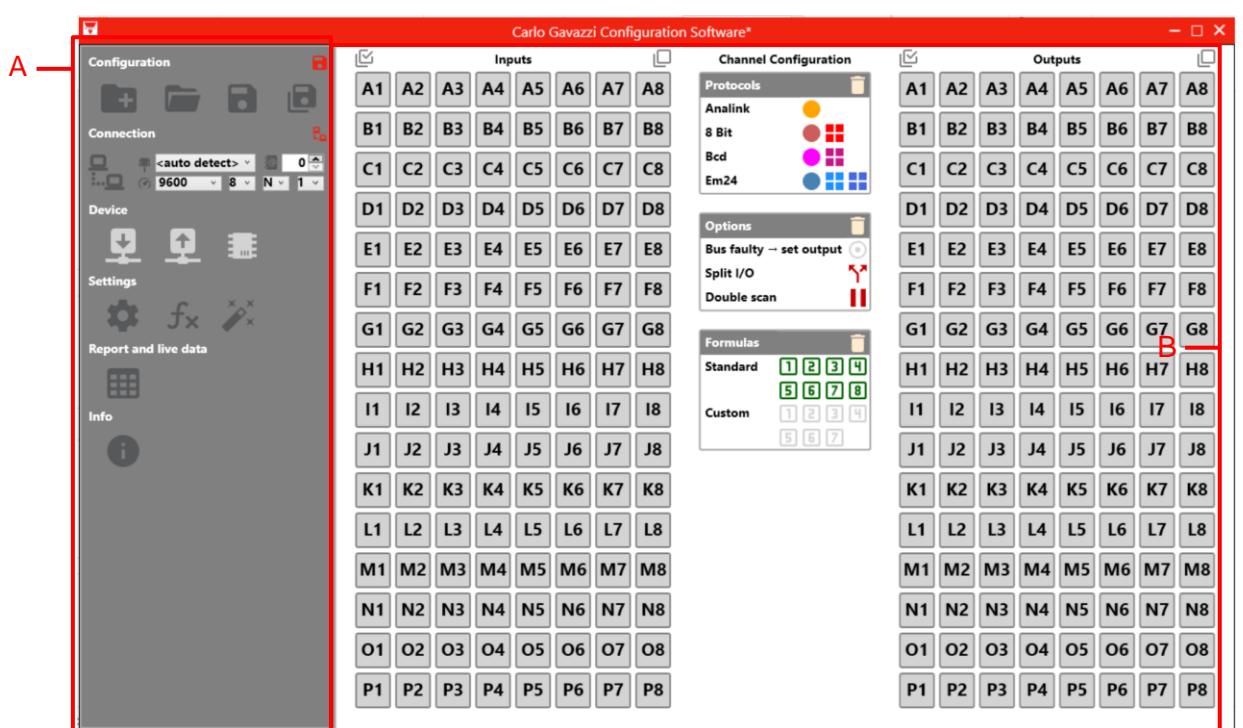

Download the software file from the link...

Run the Setup DUG xxxx.exe file.

3 USER INTERFACE

3.1 Main page

When the DUG software is started, the following window will open:

The different areas are as follows:

Area Description	
Tab	Description
A The left panel contains:	
Configuration	To open new or already saved configuration or to save a configuration
Connection	To connect the PC to a SD2DUG24 module
Device	To read a configuration from an SD2DUG24, to write a configuration into an SD2DUG24, to update the firmware of an SD2DUG24
Settings	To set different parameters, to set customised formulas, to copy the setting of a G34900000 or a G34960005
Report and live data	To export the Modbus map, to see live data on the Dupline bus
Info	To see info relevant to the software and firmware version, to open the online manual
B The right panel contains:	
Inputs	Matrix of the Dupline input channels
Channel configuration	To select the Dupline protocols
Outputs	Matrix of the Dupline output channels

3.2 Procedures

3.2.1 Create a new configuration

To create a new configuration, follow this procedure:

Step	Action
1	Click on 
2	If a configuration is already open, choose an operation from: a) Save b) Do not save c) Cancel action “New configuration”

3.2.2 Open an existing configuration

To open a configuration, follow this procedure:

Step	Action
1	Click on 
2	Select the configuration to open

3.2.3 Save a configuration

To save a configuration, follow this procedure:

Step	Action
1	Click on  (Save) or  (Save as)
2	Select the folder where the configuration has to be saved.

3.2.4 Program analink channel

To program one or more channels as analink, follow this procedure:

Step	Action
1	Click on the channel to be programmed (from A1 to P8): if one or more channels are selected, the underline is marked with a thicker line  Not selected channel  Selected channel To select more channels, click and drag them
2	Click on the orange circle on the right side of Analink : the channels will be marked in orange 

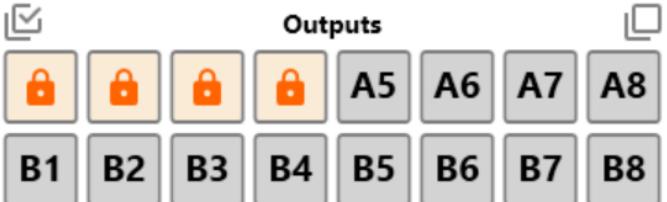

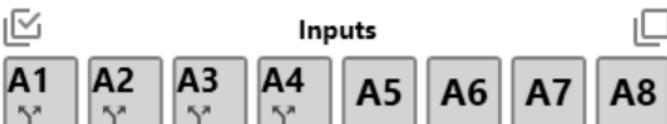

3.2.5 Program 8-bit binary protocol

To program as 8-bit binary protocol, follow this procedure:

Step	Action
1	Click on one of the channels belonging to the group to be programmed: 
2	Click on the brown circle on the right side of 8-bit : all the 8 bits belonging to the group will be marked in brown 

3.2.6 Program 8-bit binary protocol with multiplexer

To program as 8-bit binary protocol with multiplexer, follow this procedure:

Step	Action
1	Click on one of the channels belonging to the group to be programmed: 
2	Click on the red square on the right of 8-bit binary : the whole group will be marked in red and A1 to A4 output channels will be reserved for the multiplexer    <p>A1 to A4 input channels are automatically set as split I/O.</p>

3.2.7 Program 3 ½ digit BCD protocol

To program as 3 ½ digit BCD protocol, follow this procedure:

Step	Action
1	Click on one of the channels belonging to the first group to be programmed: 

- 2 Click on the pink circle on the right side of **3 ½ digit BCD**: all the 8 bits belonging to the selected and following group will be marked in pink

3.2.8 Program 3 ½ digit BCD protocol with multiplexer

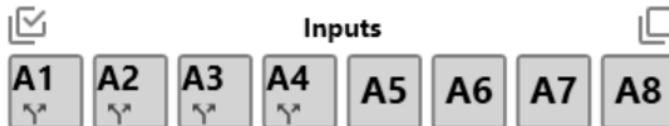

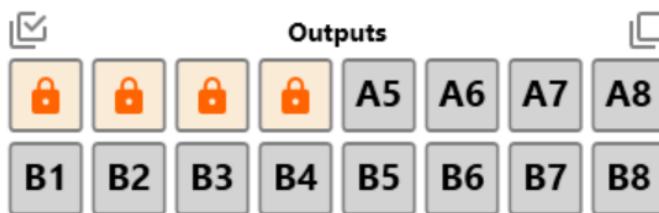

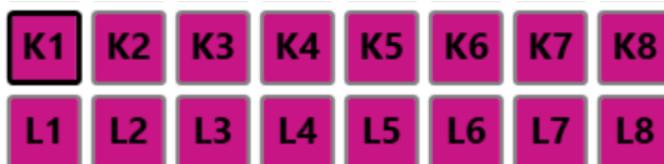

To program as 3 ½ digit BCD protocol, follow this procedure:

Step	Action
------	--------

- 1 Click on **one** of the channels belonging to the first group to be programmed:

- 2 Click on the violet square on the right side of **3 ½ digit BCD**: all the 8 bits belonging to the selected and following group will be marked in violet and A1 to A4 output channels will be reserved for the multiplexer

A1 to A4 input channels are automatically set as split I/O.

3.2.9 Multiplexer settings for 3 ½ digit BCD and 8-bit binary

To set the multiplexer parameters, follow this procedure:

Step	Action
1	Click on 
2	To set how long the value of the multiplexer has to be maintained for, fill in the field Keep multiplexer value for ...
	
3	The multiplexer values have to be defined in the Multiplexer values field: To add a new value, click on  To switch between single value or more values, click on  To delete an existing value, click on 

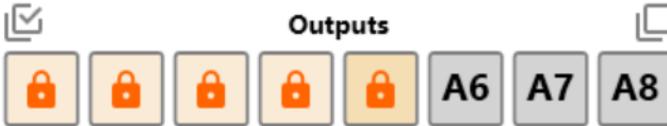

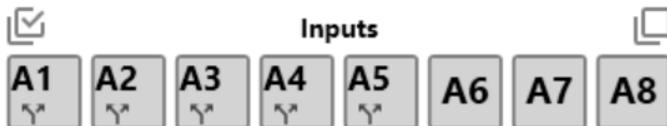

3.2.10 EM24 alarms

To dedicate one input channel to the alarm output of the EM24, follow this procedure:

Step	Action
1	Click on the channel to be programmed as retransmission of setpoint alarms: 
	A maximum of two input channels can be programmed as alarm signals from EM24
2	Click on the blue circle on the right side of EM24 : the channel will be marked in blue 

3.2.11 EM24: multiplexer (transmission of analogue data)

To program the channels to detect the analogue values sent by one or more EM24s, follow this procedure:

Step	Action
1	Click on one of the channels belonging to the first group to be programmed from G to P:
	
2	Click on the light-blue square on the right side of EM24 : all the 8 bits belonging to the selected and following group will be marked in light-blue and A1 to A4 output channels will be reserved for the multiplexer
	
	
	A5 is automatically reserved as the synchronization channel.
	
	A1 to A5 input channels are automatically set as split I/O.

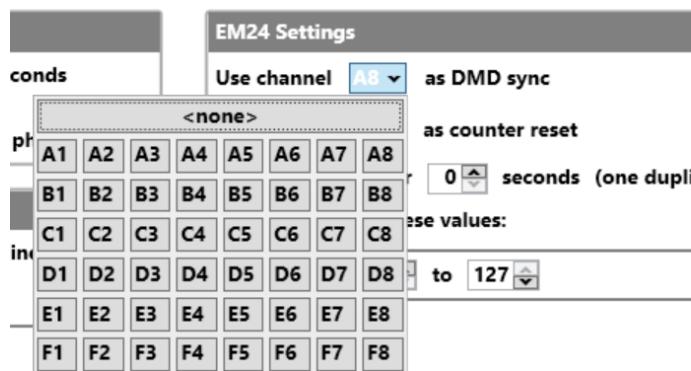

3.2.12 Set A5 channel as DMD synchronization or tariff management

The A5 output value can be set in two ways:

- Copying the status of any input channel
- Via Modbus

Step	Action
1	Copying the status of any input channel a) Click on 

- b) Select the input channel from the list, as shown below:

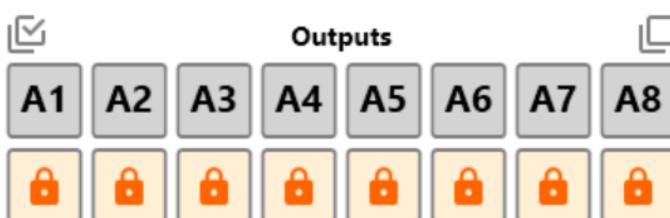

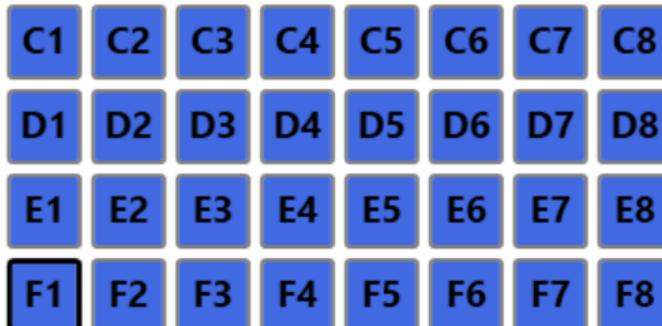

The status of this input will be reproduced on the sync channel A5

3.2.13 EM24: multiplexer (transmission of counter values)

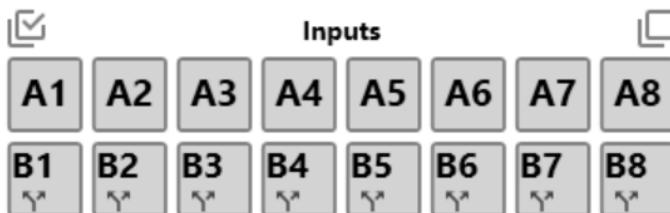

To program the channels to detect the counter values sent by one or more EM24s, follow this procedure:

Step	Action
1	Click on one of the channels belonging the first group to be programmed from C to F: 

-
- 2 Click on the blue square on the right side of **EM24**: all the 32 bits belonging to the C, D, E and F groups will be marked in blue and B2 to B8 output channels will be reserved for the multiplexer

B1 is automatically reserved as the reset channel.

B1 to B8 input channels are automatically set as split I/O.

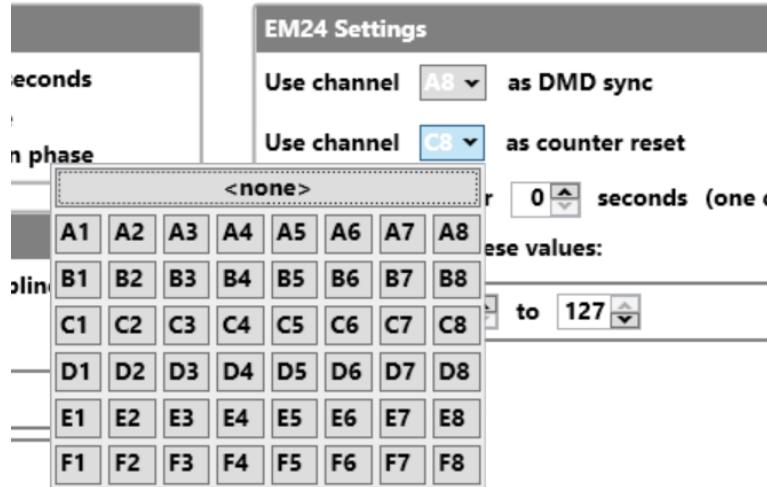

3.2.14 Set B1 channel as reset of the EM24 counter

The B1 output value can be set in two ways:

- c) Copying with the status of any input channel
- d) Via Modbus

Step	Action
1	Copying with the status of any input channel c) Click on 

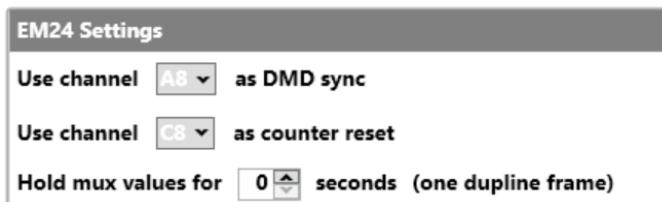

d) Select the input channel from the list, as shown below

The status of this input will be reproduced on the reset channel B1

3.2.15 Multiplexer settings for EM24 protocol

To set the multiplexer parameters, follow this procedure:

Step	Action
1	Click on 
2	To set how long the value of the multiplexer has to be maintained for, fill in the field Keep multiplexer value for ...
	
3	The multiplexer values have to be defined in the Multiplexer values field: To add a new value, click on  To switch between single value or more values, click on  To delete an existing value, click on 

3.2.16 Clear output when bus is faulty

To program the output channels so that they are reset when the bus is faulty, follow this procedure:

Step	Action
1	To enable this function, click on the icon  Check Clear output.... Set after how many seconds the output has to be reset Click on Save The action will automatically be applied to all the output channels

3.2.17 Set an output when bus is faulty

To program an output channel so that it is set when the bus is faulty, follow this procedure:

Step	Action
1	<p>To enable this function, click on the icon </p> <p>Check Clear output....</p> <p>Set after how many seconds the output has to be reset</p> <p>Click on Save</p>
2	<p>Click on the output channel to be programmed (from A1 to P8): if one or more channels are selected, the underline is marked with a thicker line</p> <p> Not selected channel</p> <p> Selected channel</p> <p>To select more channels, click and drag them</p>
3	<p>Click on the red circle on the right side of Bus faulty – set output: the channels will be marked with a small circle next to the channel name</p> <p></p> <p>The status of the selected channel will be activated each time the bus is faulty</p>

3.2.18 Split I/O

To program an input channel as split I/O, follow this procedure:

Step	Action
1	<p>Click on the input channel to be programmed (from A1 to P8): if one or more channels are selected, the underline is marked with a thicker line</p> <p> Not selected channel</p> <p> Selected channel</p> <p>To select more channels, click and drag them</p>

-
- 2 Click on the red arrows on the right side of **Split I/O**: the channels will be marked with the same symbol below the channel name

3.2.19 Double scan

To enable the double scan on one or more input channels, follow this procedure:

Step	Action
1	Click on the input channel to be programmed (from A1 to P8): if one or more channels are selected, the underline is marked with a thicker line  Not selected channel  Selected channel
	To select more channels, click and drag them
2	Click on the red double bar on the right side of Double scan : the channels will be marked with the same symbol next to the channel name 

3.2.20 Connect the PC to the SD2DUG24

To connect to the SD2DUG24 generator, follow this procedure:

Step	Action
1	Connect the SD2DUG24 to your PC, using one of the following ports: a) The Micro-USB port in the front part of the module – using a standard USB cable b) The RS485 port on the bottom of the module – using an RS485 to USB converter

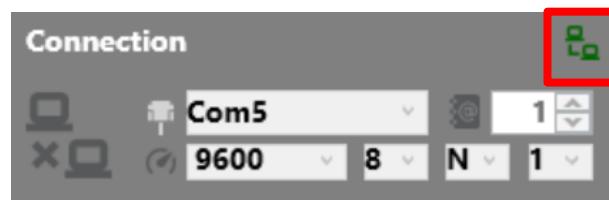

-
- 2 Select <auto detect> in the **Connection** menu, alternatively a **Com** port can be selected together with the connection parameters

Things to know

- The software shows all the detected Com ports
 - <auto detect> mode is available only when the Micro-USB port is used and the connection parameters are 9600, 8, N, 1 and they cannot be changed
 - If the Micro-USB port is used, address 0 can be used as the default address
 - If the RS485 port is used, the modbus address of the SD2DUG24 has to be used together with the proper connection parameters (the default address out of the factory is 1, while the default parameters are 9600, 8, N, 1)
-

- 3 Click on 

- 4 The Dupline generator will connect to the PC and a green icon will be shown:

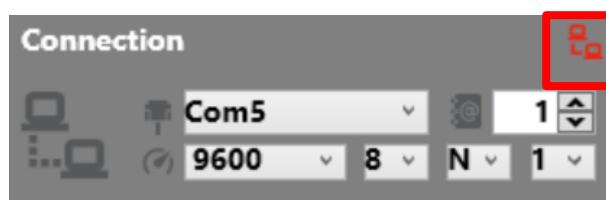

3.2.21 Disconnect the PC from the SD2DUG24

To disconnect, follow this procedure:

Step	Action
1	Click on 

-
- 2 The Dupline generator will disconnect from the PC and a red icon will be shown:

3.2.22 Send a configuration to the SD2DUG24

To send a configuration to the SD2DUG24 generator, follow this procedure:

Step	Action
1	Connect the SD2DUG24 to your PC
2	Click on 

3.2.23 Read a configuration from the SD2DUG24

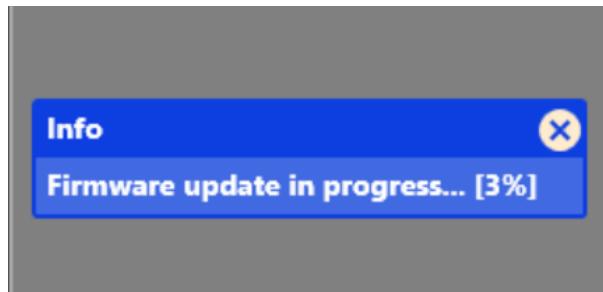

To read a configuration from the SD2DUG24 generator, follow this procedure:

Step	Action
1	Connect the SD2DUG24 to your PC
2	Click on 

3.2.24 Upgrade the SD2DUG24 firmware

To upgrade the firmware of the SD2DUG24 generator, follow this procedure:

Step	Action
1	Connect the SD2DUG24 to your PC
2	Click on 
3	The following blue window will appear, showing the status of the update:

Things to know

While a firmware upgrade is in progress, no other operation can be carried out

3.2.25 Set the name of a configuration

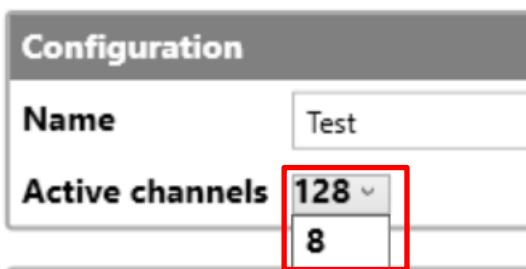

To set the name, follow this procedure:

Step	Action
2	Click on 
3	Type-in the name: 

Click on **Save**

3.2.26 Set the number of Dupline channels

To set this number, follow this procedure:

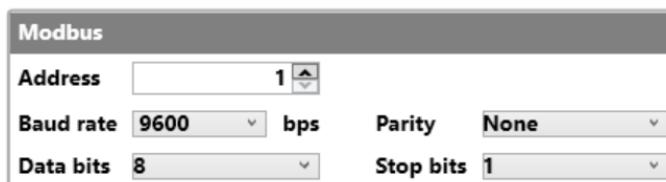

Step	Action
2	Click on 
3	Select the number required in the Active channels field: 

Click on **Save**

3.2.27 Set the communication parameters

To set the communication parameters, follow this procedure:

Step	Action
2	Click on 
3	Select the proper setting in Modbus :

Click on **Save**

Things to know

These settings are applied only to the RS485 port.

The parameters are fixed and cannot be changed on the USB port

3.2.28 Output status

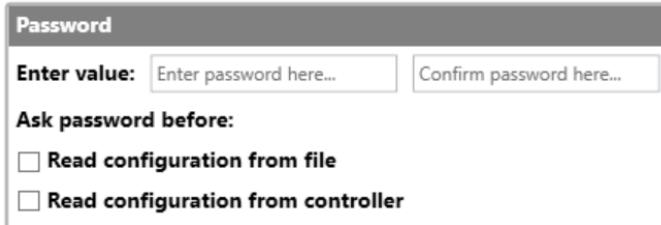

To set the output status after writing a configuration, follow this procedure:

Step	Action
2	Click on 
3	To reset the Modbus data after writing a configuration, enable Reset Modbus data after configuration phase

To keep the output status after writing a new configuration, enable **Keep output status after configuration phase**

3.2.29 Set the password

To set the password to read the configuration file or to read the configuration from the controller, follow this procedure:

Step	Action
2	Click on 
3	<p>Enter and confirm the password</p> <p>Check Read configuration from file, if the password has to protect the configuration file</p> <p>Check Read configuration from SD2DUG24, if the password has to protect the reading from the SD2DUG24</p>  <p>The dialog box is titled "Password". It contains two input fields: "Enter value:" and "Confirm password here...". Below these fields is a section labeled "Ask password before:" with two checkboxes: "Read configuration from file" and "Read configuration from controller".</p>

4 FORMULAS

4.1 Procedures

4.1.1 Link a formula to an analogue value

To apply a formula to an analogue signal, follow this procedure:

Step	Action
1	Select the channel or the group to which the formula has to be applied
2	Click on the formula

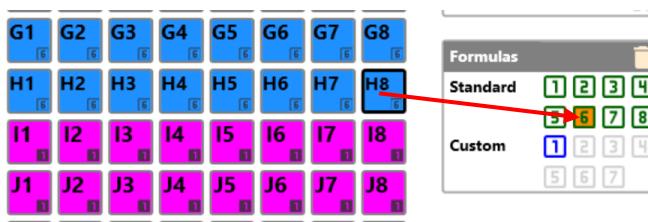

A small number will appear at the bottom right of the channel to indicate that a formula has been applied

Things to know

- The formula is applied to the raw data of the associated channels and the output will be available in the relevant Modbus address
- If the formula is a standard one, the small number indicating the formula is black and the background is the same colour of the tile containing the name of the channel
- If the formula is a customised one, the small number indicating the formula is same colour as the tile containing the name of the channel and the background is black
- If a channel with an associated formula is selected, the number indicating the formula will have a coloured background

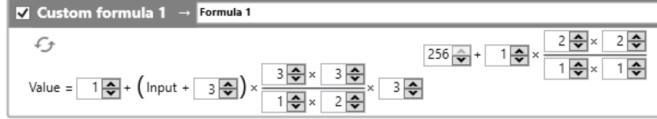

4.1.2 Standard formula

Number and name	Formula
1 – Lux type A (5 – 5000 lux)	$\text{Lux} = (10 (3 * \text{ANALINK}) / 255) * 5$
2 – Lux type B (3000-300000 lux)	$\text{Lux} = (10 (2 * \text{ANALINK}) / 255) * 3000$
3 – Wind speed	$\text{Speed [m/s]} = ((\text{ANALINK} * 25) / 255) + 5$
4 – Humidity 5-95%rH	$\text{Humidity [%rH]} = ((\text{ANALINK} * 90) / 255) + 5$
5 – Temperature 10-35°	$\text{Temperature [°C*10]} = ((\text{ANALINK} * 250) / 255) + 100$
6 – Temperature 0-50°	$\text{Temperature [°C*10]} = ((\text{ANALINK} * 500) / 255)$
7 – G432111120	$\text{Lux} = (10 (3 * \text{ANALINK}) / 128) * 0.1$
8 – BSI-TEMANA temperature	See table in Appendix

Temperatures in formulas 5 and 6 are calculated in tenths of degrees, in the Modbus map temperature values are shown in tenths of degrees as well.

4.1.3 Customised formula

To create a customised formula, follow this procedure:

Step	Action
1	Click on 
2	Enable the formula to set and name it 
3	Set the formula 

4 Associate the formula to the relevant channel

5 REPORT AND LIVE DATA

5.1 Procedures

5.1.1 Modbus map

To access the Modbus map, follow this procedure:

Step	Action																																																																																																																																								
1	Click on 																																																																																																																																								
2	The modbus map relevant to the programmed channel will be shown: <table border="1"> <thead> <tr> <th>Register Type</th> <th>I/O</th> <th>Address</th> <th>Data mask</th> <th>Address (hex)</th> <th>Data mask (hex)</th> <th>Num words</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>HR</td><td>Input</td><td>0</td><td>65535</td><td>H0000</td><td>HFFFF</td><td>1</td><td>Realtime input status A-B</td></tr> <tr><td>HR</td><td>Input</td><td>1</td><td>65535</td><td>H0001</td><td>HFFFF</td><td>1</td><td>Realtime input status C-D</td></tr> <tr><td>HR</td><td>Input</td><td>2</td><td>65535</td><td>H0002</td><td>HFFFF</td><td>1</td><td>Realtime input status E-F</td></tr> <tr><td>HR</td><td>Input</td><td>3</td><td>65535</td><td>H0003</td><td>HFFFF</td><td>1</td><td>Realtime input status G-H</td></tr> <tr><td>HR</td><td>Input</td><td>4</td><td>65535</td><td>H0004</td><td>HFFFF</td><td>1</td><td>Realtime input status I-J</td></tr> <tr><td>HR</td><td>Input</td><td>5</td><td>65535</td><td>H0005</td><td>HFFFF</td><td>1</td><td>Realtime input status K-L</td></tr> <tr><td>HR</td><td>Input</td><td>6</td><td>65535</td><td>H0006</td><td>HFFFF</td><td>1</td><td>Realtime input status M-N</td></tr> <tr><td>HR</td><td>Input</td><td>7</td><td>65535</td><td>H0007</td><td>HFFFF</td><td>1</td><td>Realtime input status O-P</td></tr> <tr><td>HR</td><td>Output</td><td>256</td><td>65535</td><td>H0100</td><td>HFFFF</td><td>1</td><td>Realtime output status A-B</td></tr> <tr><td>HR</td><td>Output</td><td>257</td><td>65535</td><td>H0101</td><td>HFFFF</td><td>1</td><td>Realtime output status C-D</td></tr> <tr><td>HR</td><td>Output</td><td>258</td><td>65535</td><td>H0102</td><td>HFFFF</td><td>1</td><td>Realtime output status E-F</td></tr> <tr><td>HR</td><td>Output</td><td>259</td><td>65535</td><td>H0103</td><td>HFFFF</td><td>1</td><td>Realtime output status G-H</td></tr> <tr><td>HR</td><td>Output</td><td>260</td><td>65535</td><td>H0104</td><td>HFFFF</td><td>1</td><td>Realtime output status I-J</td></tr> <tr><td>HR</td><td>Output</td><td>261</td><td>65535</td><td>H0105</td><td>HFFFF</td><td>1</td><td>Realtime output status K-L</td></tr> <tr><td>HR</td><td>Output</td><td>262</td><td>65535</td><td>H0106</td><td>HFFFF</td><td>1</td><td>Realtime output status M-N</td></tr> <tr><td>HR</td><td>Output</td><td>263</td><td>65535</td><td>H0107</td><td>HFFFF</td><td>1</td><td>Realtime output status O-P</td></tr> </tbody> </table>	Register Type	I/O	Address	Data mask	Address (hex)	Data mask (hex)	Num words	Description	HR	Input	0	65535	H0000	HFFFF	1	Realtime input status A-B	HR	Input	1	65535	H0001	HFFFF	1	Realtime input status C-D	HR	Input	2	65535	H0002	HFFFF	1	Realtime input status E-F	HR	Input	3	65535	H0003	HFFFF	1	Realtime input status G-H	HR	Input	4	65535	H0004	HFFFF	1	Realtime input status I-J	HR	Input	5	65535	H0005	HFFFF	1	Realtime input status K-L	HR	Input	6	65535	H0006	HFFFF	1	Realtime input status M-N	HR	Input	7	65535	H0007	HFFFF	1	Realtime input status O-P	HR	Output	256	65535	H0100	HFFFF	1	Realtime output status A-B	HR	Output	257	65535	H0101	HFFFF	1	Realtime output status C-D	HR	Output	258	65535	H0102	HFFFF	1	Realtime output status E-F	HR	Output	259	65535	H0103	HFFFF	1	Realtime output status G-H	HR	Output	260	65535	H0104	HFFFF	1	Realtime output status I-J	HR	Output	261	65535	H0105	HFFFF	1	Realtime output status K-L	HR	Output	262	65535	H0106	HFFFF	1	Realtime output status M-N	HR	Output	263	65535	H0107	HFFFF	1	Realtime output status O-P
Register Type	I/O	Address	Data mask	Address (hex)	Data mask (hex)	Num words	Description																																																																																																																																		
HR	Input	0	65535	H0000	HFFFF	1	Realtime input status A-B																																																																																																																																		
HR	Input	1	65535	H0001	HFFFF	1	Realtime input status C-D																																																																																																																																		
HR	Input	2	65535	H0002	HFFFF	1	Realtime input status E-F																																																																																																																																		
HR	Input	3	65535	H0003	HFFFF	1	Realtime input status G-H																																																																																																																																		
HR	Input	4	65535	H0004	HFFFF	1	Realtime input status I-J																																																																																																																																		
HR	Input	5	65535	H0005	HFFFF	1	Realtime input status K-L																																																																																																																																		
HR	Input	6	65535	H0006	HFFFF	1	Realtime input status M-N																																																																																																																																		
HR	Input	7	65535	H0007	HFFFF	1	Realtime input status O-P																																																																																																																																		
HR	Output	256	65535	H0100	HFFFF	1	Realtime output status A-B																																																																																																																																		
HR	Output	257	65535	H0101	HFFFF	1	Realtime output status C-D																																																																																																																																		
HR	Output	258	65535	H0102	HFFFF	1	Realtime output status E-F																																																																																																																																		
HR	Output	259	65535	H0103	HFFFF	1	Realtime output status G-H																																																																																																																																		
HR	Output	260	65535	H0104	HFFFF	1	Realtime output status I-J																																																																																																																																		
HR	Output	261	65535	H0105	HFFFF	1	Realtime output status K-L																																																																																																																																		
HR	Output	262	65535	H0106	HFFFF	1	Realtime output status M-N																																																																																																																																		
HR	Output	263	65535	H0107	HFFFF	1	Realtime output status O-P																																																																																																																																		

5.1.2 Export the Modbus map

To export the Modbus map, follow this procedure:

Step	Action
1	Click on 
2	Click on 

Thing to know

The map can be exported only if live signals are not active

3	Save the pdf file
---	-------------------

5.1.3 Live data

To check the activity of the Dupline bus, follow this procedure:

Step	Action
1	Click on 
2	Click on 

Thing to know

When live data is active, the icons will turn white

-
- 3 On the top of the page all dupline channels are shown and it is possible to change their status by clicking on them

Things to know

By clicking on the small square at the end of each group  , the status of all the 8 channels will be as follows:

First click: all the channels are activated

Second click: all the channels are deactivated

Third click: all the channels are set back to the status they had before the first click

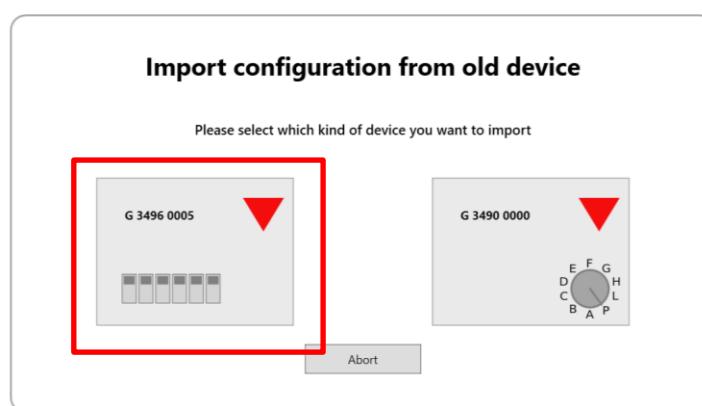

6 G34960005 OR G34900000 QUICK SUBSTITUTION

6.1 Procedures

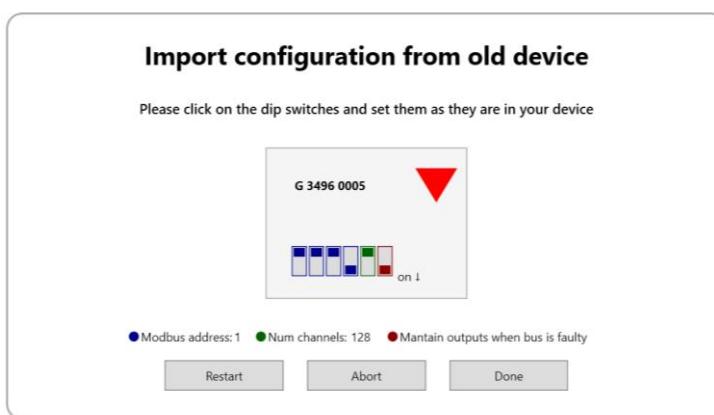

6.1.1 Substitute a G34960005

To easily and quickly copy the settings of a G34960005xxx to be substitute by an SD2DUG24, follow this procedure:

Step	Action
1	Click on 
2	Select the device by clicking on the relevant icon:

-
- 3 Set the “virtual” dip-switches, copying the ones of the G34960005

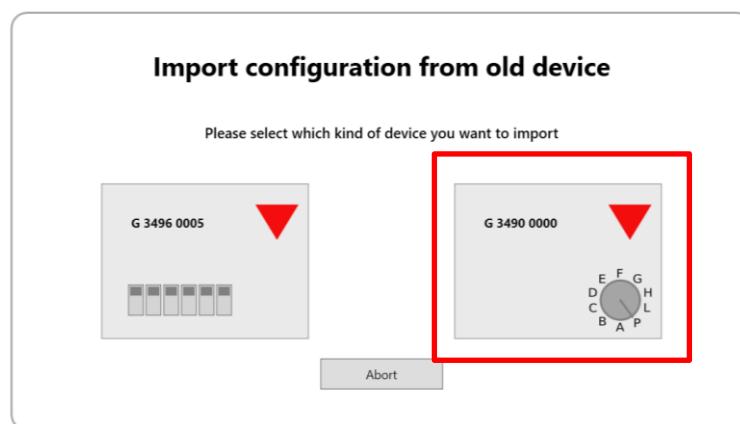

-
- 4 Click on **Done** and then on **Save**

-
- 5 Write the configuration into the SD2DUG24
-

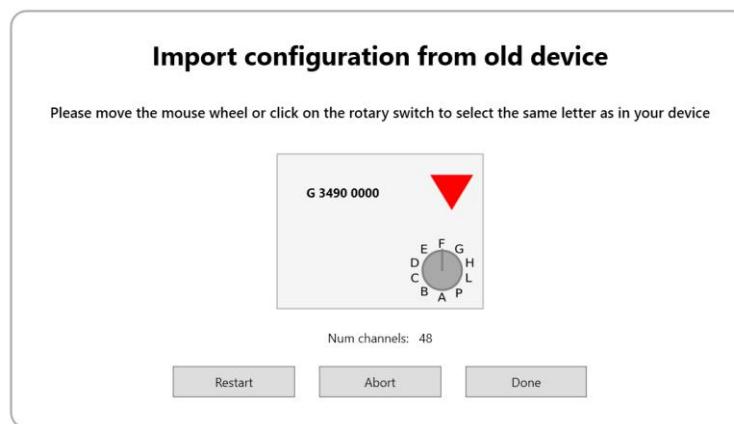

6.1.2 Substitute a G34900000

To easily and quickly copy the settings of a G34900000xxx to be substituted by an SD2DUG24, follow this procedure:

Step	Action
1	Click on 
2	Select the device by clicking on the relevant icon:

-
- 3 Set the “virtual” rotary switch, copying that of the G34900000

-
- 4 Click on **Done** and then on **Save**

-
- 5 **Write** the configuration into the SD2DUG24
-
