ABB is a leading global technology company that energizes the transformation of society and industry to achieve a more productive, sustainable future. By connecting software to its electrification, robotics, automation and motion portfolio, ABB pushes the boundaries of technology to drive performance to new levels. With a history of excellence stretching back more than 130 years, ABB's success is driven by about 110 thousand talented employees in over 100 countries.

ABB's Electrification business offers a wide-ranging portfolio of products, digital solutions and services, from substation to socket, enabling safe, smart and sustainable electrification. Offerings encompass digital and connected innovations for low voltage and medium voltage, including EV infrastructure, solar inverters, modular substations, distribution automation, power protection, wiring accessories, switchgear, enclosures, cabling, sensing and control.

ABB is committed to continually promoting and embedding sustainability across its operations and value chain, aspiring to become a role model for others to follow. With its ABB Purpose, ABB is focusing on reducing harmful emissions, preserving natural resources and championing ethical and humane behavior.

# **General Information**

ABB has over 2800 employees in Bulgaria and operates with head office in Sofia and five branch-es across the country. Two of the manufacturing units are located in Industrial area Rakovski (about 25km to the second largest city – Plovdiv). The production has already been certified ISO as mentioned below with a recognition for the company's strong process management and organizational structure, which are capable to Increase the efficiency in the development of the products, as well as in the supply and service activities.

ISO 9001:2015 - Quality Management Systems Bulgaria ISO 45001:2018- Occupational Health and Safety Assessment Series- Bulgaria ISO 50001:2018- Energy management systems- Bulgaria ISO 14001:2015- Environmental management systems – Bulgaria

Both factories successfully combine several different types of production for low and medium voltage components as LV Installation Contactors, Line Protection Devices, Components for medium voltage equipment, Low Voltage Breakers Components, Miniature Circuit Breakers, Safety switches and enclosed switch disconnectors, Surge Protection Device, Low voltage cabinets, Low Voltage Contactors components, Semi-Finished and Finished Contactors & Fusegears (Fuse switch disconnectors)

The current analysis is performed on the Installation Contactors. The ESB20..N/EN20..N/ ESB16..N installation contactors are used to control single loads up to 20 A and can be operated by AC or DC. These contactors are made for use in household applications as well as in industrial environments. In the factory, the different components and subassemblies are assembled on the manufacturing line. All components and subassemblies are produced by ABB's suppliers. These are assembled and tested as per the standards within the factory premises.

# LCA background information

## **Functional unit and Reference Flow**

The functional unit is the reference unit used to quantify the performance of the service delivered by a product to the user. The main purpose of the functional unit is to provide a reference to which inputs and outputs are related in the LCA.

Establish and cut off the supply of a downstream installation from an electrical and/or mechanical control characterised by the composition of the poles or type of contacts X, a rated voltage of Ue, a rated current le, a control circuit voltage Uc, with Np poles, and if applicable the specific specifications, in the Industrial application areas, according to the appropriate use scenario, and during the reference service life of the product of 20 years.

| Installation Contactor                      | ESB20-02N-06     |
|---|------------------|
| Ue = Rated operating voltage (V)            | 220 V DC/250V AC |
| le = Rated operating current (A) AC-1/AC-7a | 20               |
| Np = Number of poles or number of contacts  | 2                |
| Uc = control circuit voltage                | 230              |

The Reference Flow of the study is a Installation Contactor (including its packaging and accessories) with mass described, table 2.

## System boundaries and life cycle stages

The life cycle of the Installation Contactor, an EEPS (Electronic and Electrical Products and Systems), is a "from cradle to grave" analysis and covers the following main life cycle stages: manufacturing, including the relevant acquisition of raw material, preparation of semi-finished goods, etc. and processing steps; distribution; installation, including the relevant steps for the preparation of the product for use; use including the required maintenance steps within the RSL (reference service life of the product) associated to the reference product; end-of-life stage, including the necessary steps until final disposal or recovery of the product system.

The following table shows the stages of the product life cycle and the information stages according to EN 50693:2019 [3] for the evaluation of electronic and electrical products and systems.

Table 4: Phases for the evaluation of construction products according to EN50693:2019 [3].

## Temporal and geographical boundaries

The ABB component suppliers are sourced all over the world. All primary data collected are from 2023, which is a representative production year. Secondary data are also representative for this year, as provided by ecoinvent [6].

The selected ecoinvent [6] processes in the LCA model have a global representativeness, due to the unclear origin of each component. In this way, a conservative approach has been adopted.

## Boundaries in the life cycle

As indicated in the PCR capital goods such as buildings, machinery, tools and infrastructure, the packaging for internal transport which cannot be allocated directly to the production of the reference product, may be excluded from the system boundary.

Infrastructures, when present, such as processes deriving from the ecoinvent [6] database have not been excluded.

### Data quality

In this PEP, both primary and secondary data are used. Site specific foreground data have been provided by ABB. Main data sources are the bill of materials & drawings which are available on the ERP (SAP) & Windchill. For all processes for which primary are not available, generic data originating from the ecoinvent database [6], allocation cut-off by classification, are used. The ecoinvent database available in the SimaPro software [7] is used for the calculations.

The data quality characterized by quantitative and qualitative aspects, is presented in Appendix 1. Each data quality parameter has been rated according to DQR tables from Chapter 7.19.2.2 of the Product Environmental Footprint Guide v.6.3 to give an indication of geography, technology and temporal representativeness.

| SECURITY LEVEL | PEP ECOPASSPOR REG. NUMBER | DOCUMENT ID.    | REV.  | LANG | PAGE |

| Ī              |                            |                 |       |      |      |

## **Environmental impact indicators**

The information obtained from the inventory analysis is aggregated according to the effects related to the various environmental issues. According to "PCR-ed4-EN-2021 09 06" and EN 50693 [3] the environmental impact indicators must be determined using the characterization factors and impact assessment methods specified in EN 15804:2012+A2:2019 [8].

PCR-ed4-EN-2021 09 06 and the EN 50693:2019 [3] standard establish four indicators for GWP: GWP (total) which includes all greenhouse gases; GWP (fossil fuels); GWP (biogenic) which includes the emissions and absorption of biogenic carbon dioxide and biogenic carbon stored in the product; GWP (land use) - land use and land use transformation. Other indicators as per the PCR[1].

## **Allocation Rules**

Allocation coefficients are based on the ESB20..N/EN20..N/ ESB16..N line's occupancy area for electricity consumption since, apart from assembly processes, the whole production line is temperature-regulated throughout the year. The allocation of the total amount of waste generated by the production line and water consumption, has been based on this criterion.

## Limitations and simplifications

Raw materials life cycle stage includes the extraction of raw materials as well as the transport distances to the manufacturing suppliers. These distances are assumed to be 1000 km as per PCR. This distance has been added to the one already included in the market processes used for the model, as a result of a conservative choice made by the LCA operators.

Application of grease lubricant on the Installation Contactor operating mechanism has been excluded since it is negligible.

Surface treatments like galvanizing, tin and silver plating as well as their related transport processes (back and forth from the finishing suppliers) have been considered in the LCA model.

Scraps for metal working and plastic processes are included when already defined in ecoinvent[6].

# **Inventory Analysis**

In this PEP, both primary and secondary data are used. Site specific foreground data have been provided by ABB. For data collection, Bills of Material (BOM) extracted from ABB's internal SAP software were used. They are a list of all the components and assemblies that constitute the finished product, organized by level. Each item is matched with its code, quantity, weight and supplier. The BOMs were then processed, adding material, surface area and other weight data, taken from technical drawings. Finally, the manufacturing process and surface treatment were assigned, according to information provided by R&D personnel. Road distances between the suppliers and ABB were calculated using Google Maps, and marine distances using Distances & Time (Searates).

All primary data collected from ABB are from 2023, which was a representative production year. The ecoinvent v3.9 cut-off by classification system processes [6] are used to model the background system of the processes.

Due to the large amounts of components in the Installation Contactor, raw material inputs have been modelled with data from ecoinvent[6] representing either a European [RER] or Global [RoW] market coverage based on the supplier's location. These datasets are assumed to be representative.

#### Manufacturing stage

The Installation Contactor are composed of a multitude of components, all of which are made from of numerous materials. Most of the inputs to the products' manufacturing stage are already produced component parts.

The single use packaging as well as paper documentation are also included in the analysis in the manufacturing stage. ABB receives packaging components from outside suppliers and packages the Installation Contactor before shipping them.

Most of the inputs to the products' manufacturing stage are already produced component parts from the supply chain. In the ABB manufacturing plant, the different components and subassemblies are assembled into the Installation Contactor. All the semi-finished and ancillary products are produced by ABB's suppliers.

The entire Installation Contactors suppliers' network has been modelled with the calculation of each transportation stage: from the first manufacturing supplier to the next. All the distances from the last subassembly suppliers' factories to the ABB manufacturing facility have been calculated.

All the distances from the last subassembly suppliers' factories to the ABB manufacturing facility have been calculated.

In the ABB factory, the different components and subassemblies are assembled into the Installation Contactor. All the semi-finished and ancillary products are produced by ABB's suppliers.

The energy mix used for the production phase is representative for ABB Bulgaria production site and includes renewable energy only (Hydro+Solar).

The complete energy mix has been modeled considering the certificate on Guarantee of origins provided to ABB for the year 2023.

| STATUS   | SECURITY LEVEL            | PEP ECOPASSPOR REG. NUMBER | DOCUMENT ID.    | REV.  | LANG | PAGE  |
|----------|---------------------------|----------------------------|-----------------|-------|------|-------|
| Approved | Public                    | ABBG-00401-V01.01-EN       | 1SAC200416H0001 | A.001 | en   | 12/23 |
|          | ABB. All rights reserved. |                            |                 |       | _    | , -   |

#### Distribution

The transport distances from ABB manufacturing plant to the distribution centers (regional distribution centers / local sales organizations) have been calculated considering the specific 2023 sales mix data for this product cluster (SAP ERP sales data as a source).

Since no specific data is available for the transport distances from the Distribution Centre to place of actual use (Customer site), distances of 1000 km are assumed (local/domestic transport by lorry, according to PCR [1]).

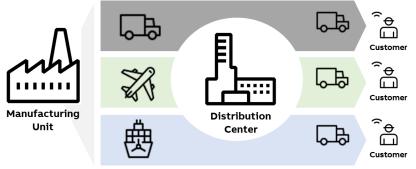

Figure 2: Distribution methodology.

#### Installation

The installation phase only implies manual activities, and no energy is consumed. This phase also includes the disposal of the packaging of the Installation Contactor.

For the disposal of the packaging after installation of the Installation Contactor at the end of its life, a transport distance of 100 km (according to PSR[2]) was assumed. The chosen transportation datasets are from Ecoinvent [6].

The actual disposal site is unknown and is managed by the customer. The disposal scenario for the European scope of the packaging was calculated based on the latest Eurostat data (EU-27) (2020) available.

#### Use

Use and maintenance are modelled according to the PCR [1].

During the use phase, Installation Contactor, dissipates some electricity due to power losses. They are calculated according to the data provided in the catalogue of the Installation Contactor and following the PCR [1] & PSR [2] rules:

| Parameters                 |         |      |
|----------------------------|---------|------|
| lu                         | [A]     | 20   |
| Load factor                | [%]     | 50   |
| h/year                     | [h]     | 8760 |
| RSL                        | [years] | 20   |
| Time operating coefficient | [%]     | 30   |

| STATUS   | SECURITY LEVEL | PEP ECOPASSPOR REG. NUMBER | DOCUMENT ID.    | REV.  | LANG | PAGE  |
|----------|----------------|----------------------------|-----------------|-------|------|-------|
| Approved | Public         | ABBG-00401-V01.01-EN       | 1SAC200416H0001 | A.001 | en   | 13/23 |

The formula for the calculation of the electricity consumed is shown below and it is described as follows, where  $P_{use}$  is the power consumed by the switch at a given value of current:

$$E_{use} [kWh] = \frac{P_{use} * 8760 * RSL * \alpha}{1000}$$

The above calculations have been performed according to the number of poles on which relevant current flows during use phase.

The Energy model used for this phase has been modelled based on the 2023 actual sales mix data (SAP ERP sales data as a source). From the Ecoinvent [6] database, the low voltage electricity country mix for each country(x) has been selected with its respective percentage on the total sales mix (Electricity, low voltage [country]x | market for | Cut-off, S).

Since no maintenance happens during the use phase, the environmental impacts linked to this procedure have been considered as null in the analysis.

#### End of life

The end-of-life stage is modelled according to PCR [1] and IEC/TR 62635 [9]. The percentages for end-oflife treatments of materials are taken from IEC/TR 62635 [9]. Since no specific data is available, the transport distances from the place of use to the place of disposal are assumed to be 1000 km (local/domestic transport by lorry, according to PCR [1]). Disassembly manuals can be provided to the customer to support product disposal.

# **Environmental impacts**

The following tables show the environmental impact indicators of the life cycle of a Installation Contactors, as indicated by PEP Ecopassport PCR and EN 50693:2019 [3]. The indicators are divided into the contribution of the processes to the different modules (upstream, core and downstream) and stages (manufacturing, distribution, installation, use and end-of-life).

#### Extrapolation for Homogeneous environmental family

This PEP covers different build configurations of ESB20..N/EN20..N/ ESB16..N Installation contactor. All the analyzed configurations have the same main functionality, product standards and manufacturing technology. The different life cycle stages can be extrapolated to other products of the same homogeneous environmental family by applying a rule of proportionality to the parameters in the following tables, divided by different life cycle stages.

For other products than the Reference product covered by this PEP, the environmental impacts for each phase of the lifecycle are obtained by multiplying the values of the Reference product by the following factor in listed table.

\*If the factor is "1", the impacts of the phase of the life cycle are same in comparison to the reference product

| Product      | GWP-total | GWP-fossil | GWP-biogenic | GWP-luluc | ODP  | AP   | EP-freshwater | EP-marine | EP-terrestrial | РОСР | ADP-minerals & metals | ADP-fossil | WDP  |

# Additional environmental information

According to the waste treatment scenario calculation in Simapro, based on the recycling rate in the technical report IEC/TR 62635 Edition 1.0 [9] Table D.6, the following recyclability potentials were calculated. The recyclability potential is calculated based on the product weight (excluding packaging).

| Product      | Recyclability potential |
|--------------|-------------------------|
| ESB20-02N-06 | 87.38%                  |
